-!- CATALYTIC ACTIVITY: ATP + A PROTEIN TYROSINE = ADP +
PROTEIN TYROSINE PHOSPHATE.
-!- SIMILARITY: CONTAINS 1 SH2 DOMAIN.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC
DOMAIN. BELONGS TO THE SRC SUBFAMILY.
                                                                                                                                                                                                                                            HYDRA ATTENUATA (HYDRA) (HYDRA VULGARIS).

Were nucleic acid encoding specific protein tyrosine phosphatases -

useful for identifying specific modulators for treatment and

prevention of cancer and neurodegenerative disease

Claim 2: Page 154-155; 193pp; English

The present invention describes isolated, enriched or purified nucleic

acids encoding PrD04, SAD, PTP05, PTP10, ALP and ALK-7 proteins. The

present sequence represents human SAD. The above proteins, other than

ALK-7, are protein tyrosine phosphatases (PTPS) and are used to identify

substances that modulate their activity (i.e. agonists and antagonists,

including NBP) in vitro. These substances are used to treat

or prevent diseases associated with abnormal signal transduction

pathways that involve the proteins, particularly cancer (e.g. leukaemia

and lymphoma), while modulators of ALK-7 (which is a type I receptor

serine/threonine kinase) are used to promote neuronal survival,

particularly for treating Alzhahamer's, Parkinson's or Huntington's

diseases. Nucleic acid fragments of the polynucleotides encoding the

Genetically engineered endothelial cells - which exhibit enhanced cell migration, urokinase-type plasminogen activator activity, and reduced monouclear cell adhesion and fibronectin prodn bisclosure; Page 64-66; 31pp; English.

C. The DNA encoding a portion or (more preferably) the entire pp60 c-src polypeptide (Given in Q46687) is used to transform endothelial cells. Transformed cells produce increased amounts of pp60 c-src and than non-transformed counterparties. They migrate at faster rates than non-transformed counterpartis; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced monouclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent implantation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  levklgggcfgevwmgtwngttrvaiktlkpgnmspeaflgeagvmkklrheklvglyav 328

While 94-03804/0.7 Computer modelling design of specific affectors - using three-dimensional conformation of enzyme affector complex three-dimensional conformation of enzyme affector complex Example; Pages 51-52; 115pp; English.

The inventors provide a crystal structure of CAMP-dependent protein kinase (CAMP, with its catalytic subunit intact. The crystals contain a bound inhibitor peptide (PKI(5-24)) which comprises a fragment of the heat stable protein kinase inhibitor (PKT). PKT, PKT, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP, CAMP

cesse polypeptide (Given in Q46688) is used to transform endothelial cells. Transformed cells produce increased amounts of pp60 c-src and have improved therapeutic properties. They migrate at faster rates than non-transformed counterparts; have an enhanced ability to inhibit the formation of thrombi and/or dissolve thrombi once they have formed and exhibit reduced monounclear cell adhesion. They can also be used to improve the success of surgical procedures such as coronary angioplasty, heart bypass surgery, vessel graft and stent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              272 levklgggcfgevwmgtwngttrvaiktlkpgtmspeaflgeagvmkklrheklvglyav 331

kinase corresp. to points of contact for cAPK and prints.

Kinase corresp. to points of contact for cAPK and PKK(5-24), and designing an inhibitor of the first protein kinase allowing ionic and hydrophobol: interactions with these residues, thus producing an inhibitor of the first protein kinase. In the example, the inventors use this methodology to design an inhibitor for pp6(c-src) which is the proto-oncogene homologue of the src protein kinase from Rous Sarcoma Virus. The invariant residues in pp60(c-src) are given in FT above. These residues are incorporated into the appropriate position using a coordinate set of the invariant residues present in most protein kinases. Once the template is in place and the catalytic site from pp60(c-src) has been superimposed onto the emplate, it is possible to visualise the catalytic site. The site can additionally be refined using the complementary target phosphorylation site for pp60(c-src) (se R32300). Residues are altered using computer modelling until a fit is achieved for Sequence 259 AA;

The sequence consists of the N-terminal amino acids of the betagalactosidase gene fused with the lck gene. It is produced by E.coli transformed with a recombinant vector (see 013983). It is useful for producing an antibody specifically immunoreactive with only a lck gene-derived polypeptide in T cells. The antibody may

The human gene encoding this protein is closely related to but distinct from the abl proto-oncogene and is a member of the tyrosine kinase encoding family of genes....Arg.is-expressed as two-transcripts. By analogy with c-abl, the alternative 5' arg sequences have been designated A and B (Q14937) and it is assumed that they are joined

The human gene encoding this protein is closely related to but distinct from the abl proto-oncogene and is a member of the tyrosine kinase encoding family of genes. Arg is expressed as two transcripts. By analogy with c-abl, the alternative 5' arg sequences have been designated A (014936) and B and it is assumed that they are joined to the arg second exon.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         348

Cytoplasmic tyrosine kinase and antibody recognising it - for screening chemical substances for tyrosine kinase inhibitory or activating activity for use as cancer therapy claim 1; Page 40-42; 58pp; English.

A cytoplasmic tyrosine kinase which has enhanced expression in connection with blood cell differentiation has been isolated from the human UT-7 blood cell line. This sequence comprises an N-terminal truncated fragment of the enzyme (residues 42-507 of R71133). The DNA screening agents for inhibiting or activating activity on the tyrosine kinase, for use as anticancer agents.

Claim 15: Fig 18-C: 82pp: English.

Human megakaryocyte kinase MKK1 (R84181) is a 58 kDa cytosolic tyrosine kinase showing 54% homology with csk. It appears to play a regulatory role in the growth and differentiation of megakaryocytes and perhaps neural tissues. Recombinant MKK1 can be produced in host cells by expression of encoding cDNA (T00616), and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Cytoplasmic tyrosine kinase and antibody recognising it - for screening chemical substances for tyrosine kinase inhibitory or activative for use as cancer therapy
Claim 1: Page 42-44; 58pp; English.
A cytoplasmic tyrosine kinase which has enhanced expression in connection with blood cell differentiation has been isolated from the human UT-7 blood cell line. The DNA sequences and antibodies raised against the enzyme, are usful for screening agents for inhibiting or activating activity on the tyrosine kinase, for use as anticancer agents. Sequence 507 AA:
                                                                   .

                                                                                                                                                                                                 Cytoplasmic tyrosine kinase BMX and related DNA - useful to stimulate haematopoietic cell growth.

Disclosure; Page 25-27; 40pp; English.

Cytoplasmic tyrosine kinase TEC (R94536) is expressed in murine haematopoietic cells. The sequences of TEC and 2 other members of a newly-identified non-receptor tyrosine kinase family, ITK (R94538) and BTK (R94534), and of the Drosophila Src28C tyrosine kinase (R94538), were compared with that of novel cytoplasmic tyrosine kinase BMX (see also R94533). Close homology was found.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 373 relgsglfgvvrlgkwragykvaikairegamceedfieeakvmmklthpklvglygvct 432

J. Biol. Chem. (1989) 264:10649-10653
The two Xenopus laevis SRC genes are co-expressed and
produces functional pp(60src).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PID:9214797
